

## Project: Landing Page

### Foundations Course

### Introduction

For this project you'll be creating an entire web page from a design we'll provide for you. If you've been following along you should have the skills you need to accomplish this, but it may not be easy!

The design we're providing you comes in the form of 2 images: one is an image of the complete website, and one has some details about some of the fonts and colors we've used.

Do *not* be afraid to use google or go back to previous lessons to look something up. **In real life, professional developers use google *constantly* for things that they have been doing for years.** At this point it is not expected that you will have everything memorized, so don't worry about it. Additionally, there are a few small details that you may not have encountered in our lessons yet. *This is by design.* These details are minor, and easily searched (e.g. google `css rounded corners` ).

Get your project as close as you can to the design, but do not worry about getting it pixel-perfect. Don't get out your ruler or count pixels to find the exact margins between the various sections. The point of this assignment is to create something from scratch and get the various elements in more or less the right position relative to the rest. It doesn't matter if you use `margin: 24px` when the design actually has `margin: 48px` .

*Finally*, feel free to substitute your own content into this design. The images have some meaningless dummy content, but if you want to make up a business and personalize this page, please feel free to do so! Insert actual images in the placeholders, and feel free to play with the colors and fonts a bit too.

#### A note about images on the web

You do not have the legal right to use just any image that you find on the web. There are many free images to be found, but make sure that the image you use is actually free for you to use, and make sure to credit the creator of the image in your project. An easy way to give credit is to put the creator's name and contact info in a README file in your repository.

Some good places to find free-to-use images on the web include [Pexels](#), [Pixabay](#), and [Unsplash](#).

### Setting up your project's GitHub repository

As we did in the Recipes project, go ahead and set up a git repository before beginning work on this project. Git and GitHub are going to act as a portfolio for you moving forward, so you need to keep everything in there! Look back at the [Recipes project](#) if you need a reminder on how to set it up.

### Warning about looking at other people's finished project code before you have completed your own

All of our projects have a "Student Solutions" section at the bottom for people to post their completed code and live websites for the projects. These are here for you both to compare your completed code with and see what other routes people have chosen to take with their project code and designs.

We know it may be tempting to look at the solutions when you get stuck or don't know where to start, but **don't** do it! Here are some reasons why:

- All of the submitted projects are *other learners'* solutions. This means they are written by other people who are also still learning and may not necessarily be representative of "best practice" or high quality code.
- Looking at solutions robs you of the chance to develop your problem solving and researching skills. In the real world, there will not always be "solutions" for you to look at, and you will have to come up with your own.
- There are many different ways to achieve the same end result - it is not "one size fits all."
- An Analogy: "Learning how to code from looking at completed code is like learning how to make pizza dough from looking at a baked pizza." There is a lot more that goes into it than you might assume from only seeing the final product and not the process that led to it.

Once you have completed your project, feel free to look at the other solutions to see alternative ways the project was completed.

**DO NOT PEEK. Come ask for help in our [Discord server](#)! (You need to [join the Discord server](#) first in order to see the channel).**

### Assignment

Don't forget to commit early & often! You can [reference the Commit Message lesson here](#)!

1. Download the design images and take a look at what you're going to be creating here. [Image One \(Full Design\)](#), [Image Two \(Color and Fonts\)](#)
  1. The font that's being used in the images is roboto.
  2. Hero text is the statement that appears at the top of a web page.
2. There are many ways to tackle a project like this, and it can be overwhelming to look at a blank HTML document and not know where to start. Our suggestion: take it one section at a time. The website you're creating has 4 main sections (and a footer), so pick one and get it into pretty good shape before moving on. Starting at the top is always a solid plan.
3. For the section you're working on, begin by getting all the content onto the page before beginning to style it. In other words, do the HTML and *then* do the CSS. You'll probably have to go back to the HTML once you start styling, but bouncing back and forth from the beginning will take more time and may cause more frustration. (Note: you don't need to use more than one stylesheet. Using only one CSS file is adequate for this project).
4. Many of the elements on this page are very similar to things you saw in our flexbox exercises... feel free to go back to those if you need a refresher.
5. Do not worry about making your project look nice on a mobile device. We'll learn that later.
6. When you finish, don't forget to push it up to GitHub!

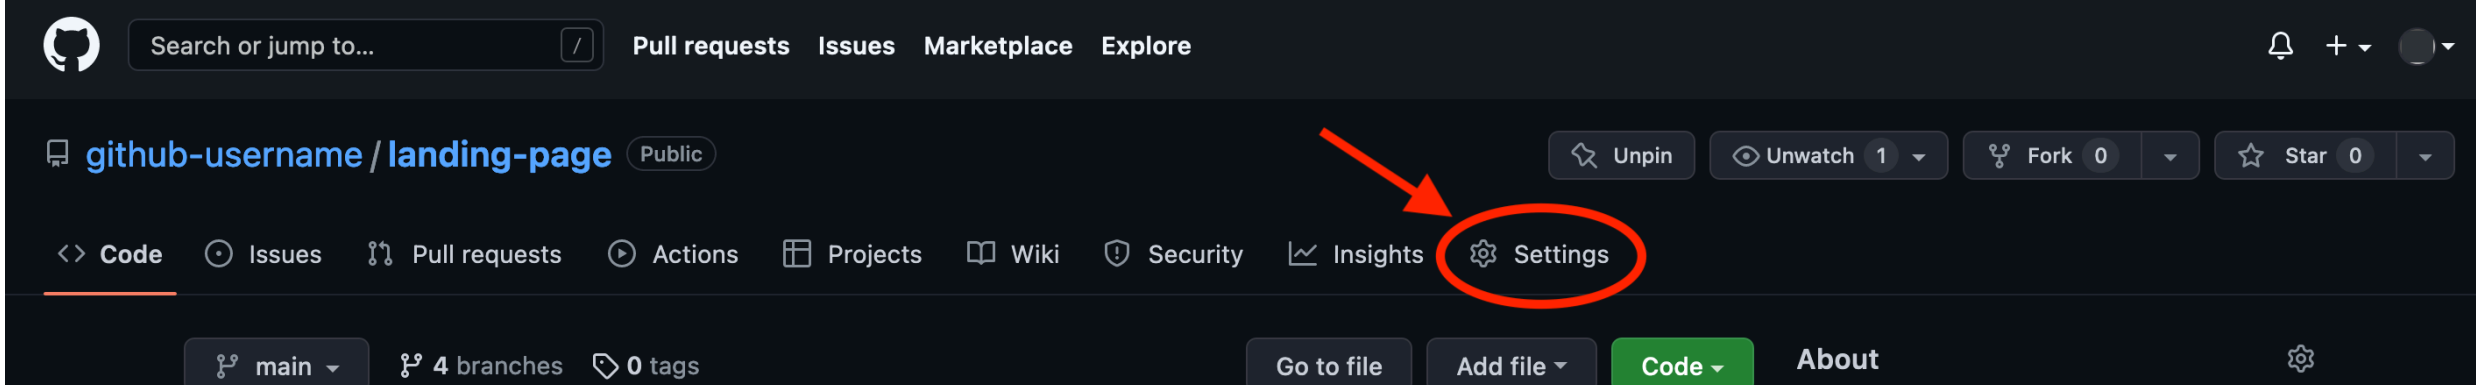

### Viewing your project on the web

If you want to show your work (the project) to others, or submit a solution below, you will need to publish your site so that others can access it from the web, rather than just on your local machine. The good news is that if you have your project on GitHub (as described above), then doing this is straightforward.

GitHub allows you to publish web projects directly from a GitHub repository. Doing this will allow you to access your project from `your-github-username.github.io/your-github-repo-name`

There are a couple of ways to go about publishing your project, but the simplest is the following:

- Make sure that the main HTML file of your project is called `index.html` . If it is not, you need to rename it.
- Go to your GitHub repo on the web and click the **Settings** button as shown in the screenshot below.

- Click on **Pages** on the left side bar.
- Change the **Branch** from *none* to *main branch* and click Save.
- It may take a few minutes (the GitHub website says up to 10), but your project should be accessible over the web from `your-github-username.github.io/your-github-repo-name` (obviously substituting your own details in the link).
